It tries to summarize the development of asset pricing models and their merits. This book contains a lot of derivations, some of which are not obvious. There are many typos in the Kindle version that I have read. However, I gained a broad sense of the role asset pricing plays in a macro environment. Although what I gained does not benefit me directly financially, it does make me aware of how other market participants approach asset pricing.

This introduction to general equilibrium modelling takes an integrated approach to the analysis of macroeconomics

and finance. It provides students, practitioners, and policymakers with an easily accessible set of tools that can be used to analyze a wide range of economic phenomena. Key features: **•** Provides a consistent framework for understanding dynamic economic models **•** Introduces key concepts in finance in a discrete time setting **•** Develops simple recursive approach for analyzing a variety of problems in a dynamic, stochastic environment **•** Sequentially builds up the analysis of consumption, production, and investment models to study their implications for allocations and asset prices **•** Reviews business cycle analysis and the business cycle implications of monetary and international models **•** Covers latest research on asset pricing in overlapping generations models and on models with borrowing constraints and transaction costs **•** Includes end-of-chapter exercises allowing readers to monitor their understanding of each topic Online resources are available at www.cambridge.org/altug_labadie

"This is an excellent text from many perspectives. Concepts and model constructs discussed are clearly and precisely laid out, always in the context of ample intuition. All the necessary understanding is built up from scratch in the early chapters of the book, giving the reader an excellent preparation for later chapters. As an introduction to general equilibrium macro-modeling cum asset pricing, it is exceptional, most especially for beginning researchers. Important empirical aspects are featured as well." - John Donaldson, Mario J. Gabelli Professor of Finance, Columbia Business School
